

INTEGRATED TECHNOLOGY SOLUTIONS FOR ISO 27001 COMPLIANCE

Are you looking to become ISO 27001 compliant? To meet the rigorous information security requirements of ISO 27001 requires an audit and, in most cases, new solutions that demonstrate compliance.

The ISO 27001 certification shows your customers that you have completed a thorough assessment of potential risks and threats to your information technology. By identifying these risks and taking proactive steps to control or manage them, you demonstrate your organization's commitment to data security.

One key element of ISO 27001 certification is demonstrating a cohesive, high-level approach to your information security management system. ISO 27001 requires organizations to develop a comprehensive security strategy that demonstrates:

- Asset protection
- Business continuity planning
- Cybersecurity strategy
- Data breach security
- Downtime reduction
- IT governance
- Incident management
- Security policy
- Threat mitigation

WHY COMPLY?

Demonstrating a systematic commitment to data security opens up new business opportunities and is mandated in certain industries. Compliance also improves customer relationships while demonstrating your organization's deep commitment to security.

BCS, in partnership with QPS (Quality & Productivity Solutions, Inc.), can evaluate your existing information security strategy. Based on an assessment of your technology, BCS will develop a remediation plan that provides you with the right technical solutions that meet ISO 27001 requirements.

INTEGRATING TECHNOLOGY SOLUTIONS

CHALLENGES.

ISO 27001 certification mandates that management:

- Examine the organization's information security risks systematically. This assessment must include consideration of potential threats, vulnerabilities and consequences
- Create and deploy a comprehensive suite of security controls for the organization's information systems. Risk avoidance and risk transfer may be used to address identified risks

In order to create a compliant solution, companies need to consider a comprehensive approach to risk assessment with rules that cover the entire organization. They need to implement the risk assessment by:

- Cataloging all company assets
- Identifying the threats to and vulnerabilities of each asset
- Assessing the impact and likelihood of each threat and vulnerability
- Calculating the overall risk
- Prioritizing the risks and focusing on solutions for the most critical unacceptable risks
- Developing solutions to each priority risk, whether by stopping the activity, transferring the risk to a third party, accepting the risk, or applying a security control with BCS
- Completing a report of the risk assessment work
- Building and deploying a risk treatment plan

SOLUTIONS.

With BCS as your partner, your organization can deploy ready-to-use solutions that meet or exceed regulatory standards. Our experienced engineers and technicians help with compliance solutions that deliver maximum security and data availability with:

- Proactive monitoring of networks, desktops and connected devices
- 24/7/365 U.S.-based help desk support
- Asset management and inventory control
- Authorization and authentication management
- Voice and video communications solutions
- Wireless network configuration and installation
- Cloud computing and storage

ABOUT BCS.

BCS offers end-to-end managed technology solutions. We understand your unique operational needs and provide customized solutions. We develop long-term relationships, providing systems and technology infrastructure that scale with your growth.

We create cost-effective, seamless solutions that keep your employees, partners and customers well connected.

BCS is more than a technology solutions provider: We are a partner to help drive your business goals.
